# ELITE PROJECT - EXTENSION IN OUATERNION GROUP <br> ABHAS MISHRA*, PARAMHANS KUSHWAHA*, SAMEEKSHA PRADHAN*, DR. SARITA AGARWAL** <br> * Students of B.Sc.(H) Mathematics <br> ** Assistant professor in department of Mathematics (Mentor) <br> ABSTRACT 

In this project, we have worked on Quaternions. We created the quaternion field and space. We have integrated quaternions with some examples of nature. Rotation of the earth is a quaternion ring, cyclooctane constructed by $\mathrm{CH}_{2}$ and CH are similar to the quaternion octane by taking $\pm 1= \pm \mathrm{i}= \pm \mathrm{j}= \pm \mathrm{k}=\mathrm{CH}_{2}$ and CH. The movement of a Cubesat is a group action on the quaternions and a cubesat itself is a quaternion space. Even the movement of a football is a rotation of the quaternions.

INTRODUCTION
Quaternion group consist of 8 elements namely $\pm \mathbf{1}, \pm \mathbf{i}, \pm \mathbf{j}, \pm \mathbf{k}$, where $\mathrm{i}^{2}=\mathrm{j}^{2}=\mathrm{k}^{2}=-1, \mathrm{ij}=$ $\mathrm{k}, \mathrm{jk}=\mathrm{i}, \mathrm{ki}=\mathrm{j}, \mathrm{ji}=-\mathrm{k}, \mathrm{kj}=-\mathrm{i}, \mathrm{ik}=-\mathrm{j}$.

$\mathrm{Q}_{8}$ is a non commutative group as $\mathrm{ij} \neq \mathrm{ji}$

## PROPERTIES

1. $\mathrm{Q}_{8}$ has 6 subgroups.
2. $\mathrm{Q}_{8}$ is non-cyclic but every proper subgroup of $\mathrm{Q}_{8}$ is cyclic.
3. Every proper subgroup of $\mathrm{Q}_{8}$ is normal.
4. Every proper subgroup of $\mathrm{Q}_{8}$ is abelian.
5. $\mathrm{Z}\left(\mathrm{Q}_{8}\right)=\{1,-1\}$.

## OUATERNION RING

Definition:- A non-empty set $\mathbf{Q}_{\mathbf{8}}=\left\{a+b i+c j+d k \mid a, b, c, d \in R, i^{2}=j^{2}=k^{2}=-1, i j\right.$ $=\mathrm{k}, \mathrm{jk}=\mathrm{i}, \mathrm{ki}=\mathrm{j}, \mathrm{ji}=-\mathrm{k}, \mathrm{kj}=-\mathrm{i}, \mathrm{ik}=-\mathrm{j}\}$, where R is any ring, is the ring as The set $\mathrm{Q}_{8}$

1. is an abelian group under addition.
2. is a semi group under multiplication.
3. satisfies left and right distributive properties.

And this ring is known as quaternion ring.
QUATERNION FIELD
A non-empty set $\mathbf{Q}_{8}=\left\{\mathrm{a}+\mathrm{bi}+\mathrm{cj}+\mathrm{dk} \mid \mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{F}, \mathrm{i}^{2}=\mathrm{j}^{2}=\mathrm{k}^{2}=-1, \mathrm{ij}=\mathrm{k}, \mathrm{jk}=\mathrm{i}, \mathrm{ki}\right.$ $=\mathrm{j}, \mathrm{ji}=-\mathrm{k}, \mathrm{kj}=-\mathrm{i}, \mathrm{ik}=-\mathrm{j}$, where F is a field $\}$, is a skew field as
the set $\mathrm{Q}_{8}$

1. is an abelian group under addition.

2 . is a semi group under multiplication.
3. satisfies left and right distributive properties.
and
We have the multiplicative identity of $\left(\mathrm{Q}_{8}, \cdot\right)$ is $1=1+0(\mathrm{i}+\mathrm{j}+\mathrm{k})$
with the inverse of $\mathrm{a}=1 / \mathrm{a} \forall \mathrm{a} \neq 0$.
and inverse of $\mathrm{a}+\mathrm{bi}=(\mathrm{a}-\mathrm{bi}) /\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right)$ where either a or b is nonzero.
and inverse of $a+b i+c j=(a-b i-c j) /\left(a^{2}+b^{2}+c^{2}\right)$ where either $a, b$ or $c$ is nonzero.
and inverse of $a+b i+c j+d k=(a-b i-c j-d k) /\left(a^{2}+b^{2}+c^{2}+d^{2}\right)$ where either $a, b, c$ or $d$ is nonzero.
Since every element of $\mathrm{Q}_{8}$ has its inverse in $\mathrm{Q}_{8}, \mathrm{Q}_{8}$ is a division ring as $\mathrm{Q}_{8}$ is non-abelian. Therefore,
$\boldsymbol{Q}_{8}$ is a skew field. This is to be called Quaternion field.

## QUATERNION SPACE

Vector Space:-Let $S$ be a non-empty set, then the set $S$ with two binary operations vector addition and scalar multiplication (.), is said to be a vector space over a field $F(=R)$ if the following properties hold for every $\mathrm{A}, \mathrm{B}, \mathrm{C} \in \mathrm{S}$ and $\mathrm{a}, \mathrm{b} \in \mathrm{R}$ :-

1. (S,+) forms an abelian group.
2.S is closed under scalar multiplication.
3.S satisfies the associative property with scalar multiplication.
2. For $\forall x \in S, 1 . x=x$.
3. S satisfies the distributive property of scalar multiplication over vector addition.
7.S satisfies the distributive property of vector multiplication over scalar addition.
$\mathbf{Q}_{\mathbf{8}}=\left\{\mathrm{a}+\mathrm{bi}+\mathrm{cj}+\mathrm{dk} \mid \mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{F}, \mathrm{i}^{2}=\mathrm{j}^{2}=\mathrm{k}^{2}=-1, \mathrm{ij}=\mathrm{k}, \mathrm{jk}=\mathrm{i}, \mathrm{ki}=\mathrm{j}, \mathrm{ji}=-\mathrm{k}, \mathrm{kj}=-\mathrm{i}\right.$
, $\mathrm{ik}=-\mathrm{j}$, where F is a field $\}$ satisfies the above mentioned properties, therefore it forms a vector space over $F$. This is to be called quaternion space.

## APPLICATIONS

APPROACH IN CHEMISTRY
Conformation of organic cyclic compounds :- In organic compounds such as cyclooctatetraene $\left(\mathrm{C}_{8} \mathrm{H}_{8}\right)$ and cyclooctane $\left(\mathrm{CH}_{2}\right)_{8}$. We can relate with a closed figure with 8 vertices where every Carbon can be compared with a distinct element of $\mathrm{Q}_{8}$.

Both figures can be compared with this

Where $| \pm \mathbf{1}|=| \pm \mathbf{i}|=| \pm j|=| \pm \mathbf{k}|=$ one mole of $\mathbf{C H}_{2}$ in first case and one mole of $\mathbf{C H}$ in second case, and $\pm 1= \pm \mathrm{i}= \pm \mathrm{j}= \pm \mathrm{k}=\mathrm{CH}_{2}$ in first case and CH in second case . APPROACH IN GEOGRAPHY
Globe:- A globe is a 3-D spherical, scale model of earth or other celestial body such as a planet or moon. We know that globe is a model of earth, where line drawn by joining north pole and south pole plays the role of axis of rotation.

We can arrange the quaternions in the form given below

This form is similar to the globe, though globe is bent with an angle of $231 / 2^{\circ}$, where $\pm 1$ stands for two poles and $\pm \mathrm{i}, \pm \mathrm{j}, \pm \mathrm{k}$ are the points at equator line. If we rotate earth in step of $72^{\circ}$, then every point will at the place as it was initially, after 5th rotation as $x^{5}=x, \forall x \in Q_{8}$ From the top of the axis, rotations will look like figures given below:-

## GROUP ACTION

Definition:- A group action of a group G on a set A is a map from $\mathrm{G} \times \mathrm{A}$ to A satisfying the following properties:
(1) $\mathrm{g}_{1} \cdot\left(\mathrm{~g}_{2} \cdot \mathrm{a}\right)=\left(\mathrm{g}_{1} \mathrm{~g}_{2}\right) \cdot \mathrm{a}$ for all $\mathrm{g}_{1}, \mathrm{~g}_{2} \in \mathrm{G}, \mathrm{a} \in \mathrm{A}$, and
(2) $1 \cdot \mathrm{a}=\mathrm{a}$, for all $\mathrm{a} \in \mathrm{A}$

Let the group G acts on a set A . For each fixed $\mathrm{g} \epsilon \mathrm{G}$, map $\sigma \mathrm{g}$ defined by $\sigma \mathrm{g}: \mathrm{A} \rightarrow \mathrm{A}$ $\sigma g(a)=g \cdot a$

$$
\sigma 1(\mathrm{a})=1 \cdot \mathrm{a}=\mathrm{a}, \text { where } \mathrm{a} \in \mathrm{Q} 8
$$

$(1-1)(i-i)(j-j)(k-k)$

$$
\sigma-1(a)=-1 \cdot a \text {, where } a \in Q_{8}
$$

$(1 i-1-i)(j k-j-k)$

$(1-i-1 i)(j-k-j k)$

$(1 k-1-k)(i j-i-j)$

$$
\sigma-i(a)=-i \cdot a, \text { where } a \in Q_{8}
$$

$\sigma j(a)=j \cdot a$, where $a \in Q_{8}$

$$
\sigma-j(a)=-j \cdot a, \text { where } a \in Q_{8}
$$

$(1-k-1 k)(i-j-i j)$

$$
\sigma-k(a)=-k \cdot a, \text { where } a \in Q_{8}
$$

## APPROACH IN PHYSICS

Cubesat :- A cubesat is a type of small satellite for space research that is made up of multiple $10 \times 10 \times 10 \mathrm{~cm}$ cubic units. Cubesats have a mass no more than 1.33 Kg per unit. Cubesats are most commonly put in orbit by deployers on the International Space Station. Basically, it has 8 vertices that's why it can be compared to $\mathrm{Q}_{8}$.

The movement of the above satellite can be studied by the group action of $\mathbf{Q}_{8}$ on itself, This can be understood by labelling 8 vertices of cubesat as $\pm 1, \pm \mathrm{i}, \pm \mathrm{j}, \pm \mathrm{k}$ same as the above diagram of $\sigma$ i and $\sigma$-i . Cubesat will rotate in clockwise direction and anticlockwise through group action $\boldsymbol{\sigma}_{\mathrm{i}}$ and $\boldsymbol{\sigma}_{-\mathrm{i}}$.

$(1 i-1-i)(j k-j-k)$
Clockwise Rotation
$\sigma_{i}(x)$

$(1-i-1 i)(j-k-j k)$
Anticlockwise Rotation
$\sigma_{-i}(x)$

Application of rotation of $Q_{8}$ in sports:- The movement of football can be compared with group action of $\mathrm{Q}_{8}$ on itself, This can be understood by the rotations due to group actions $\boldsymbol{\sigma}_{\mathrm{k}}$ and $\boldsymbol{\sigma}_{-\mathrm{k}}$.

$(1 k-1-k)(i j-i-j)$
$\sigma_{k}(x)$

$(1-k-1 k)(i-j-i j)$
$\sigma_{-k}(x)$

## ACKNOWLEDGEMENT

We are thankful to Dr. Savithri Singh, Principal,ANDC(University of Delhi) for granting us summer fellowship under ELITE scheme(Education in Lively and Innovation Training Environment). It has helped us in realizing our investigative acumen, generated from classroom learning in actual practice.
We are grateful to faculty member Dr. Sarita Aggarwal for her constant guidance and motivation.
At last but not the least, we owe a deep sense of gratitude to all friends, colleagues and family for their good wishes and perservance.

## CONCLUSION

We have extended Quaternion ring to quaternion field and to quaternion space. Apart from this, we went through some of its applications, which behaved as some of the applications of Physics, Chemistry, and Geography .
